

“Contour Light is the answer everyone has been looking for to reduce excess fat deposits and improve the appearance of cellulite” says Dr. _____, Founder and Clinical Director of _____.

“It is specifically designed to target fat; it works with absolutely no pain and requires no recovery time. Best of all, you can see immediate results on most patients. The treatment is comfortable and so relaxing that many patients will read, listen to music, or even nap during the session.”

The technology is based on NASA research of light energy and leading clinicians. Contour Light does not use surgery, lasers, heat, freezing, ultrasound cavitation, microwaves or Radio Frequency; in other words, it does not cause damage like those technologies, but rather it creates a healing and stimulating effect within the skin. That is why it is 100% safe for both patients and clinicians. The red light generated by the Contour Light safely penetrates the skin and is absorbed by the fat cells. The light stimulates the mitochondria of the fat cell, causing the cell membrane to open tiny pores and release the cell contents, a process known as lipolysis. The fat cells then deflate while the body naturally evacuates the excess fat via the body’s metabolic process. Contour Light offers a safe and effective spot fat reduction solution that can be applied to many problem areas such as the abdomen, hips, buttocks, thighs, arms and chin. Immediately after the 30-minute sessions, patients may return to their normal daily activities including exercise.
